## We guarantee

- combination of the advantages of standard software solutions and individual software development
- replacement of an enormous functional specification document by a crucial point specification.
- data migration during operation
- spontaneous modification during operation within a few seconds
- 5 to 10 times faster software development with **e30**
- application development by activating functions without coding
- 70-90% shorter training time for **e30** than for conventional coding languages
- system support for future client-, server- and database systems
- support for individual modifications of our solutions
- free release updates
- a customer-driven development process
- open and realistic software project management

**ERP & Logistic**  
**transparent. flexible. individual.**

## The challenge.

Your software applications are heterogeneous, out of date and inflexible. But they have to be adapted to the rapidly changing processes in your company. Adapting your old system would require a huge effort.

You will need a new software system, which means

- adapting business processes to an inexpensive standard software system
- investing a lot of money and resources for implementing this new system
- hard and fraught project management
- large effort to integrate old systems into the new one.

## There is another way.

**e60** is a multifunctional, flexible ERP and logistic software system.

- easy to adapt to your business processes
- rapidly applicable
- functionally extendable
- easily integratable into existing systems
- impress with an incomparable cost-benefit ratio

## Multi-client-server applications.

Adapt **e60 ERP & Logistic** once for the

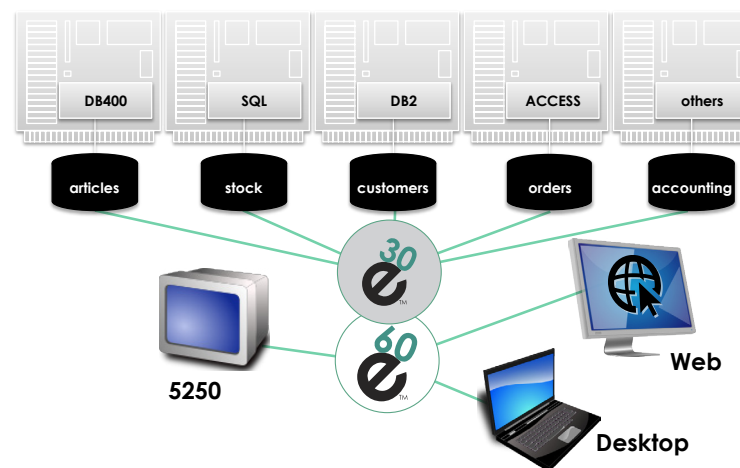

- desktop client
- web client
- 5250 client

without compiling and in real-time.

## For heterogeneous environments.

### Developing without compiling.

The **e30 Framework** makes it possible to integrate applications rapidly and easily into heterogeneous software environments. After just a short training session an internal team can already adapt **e60** to individual requirements.

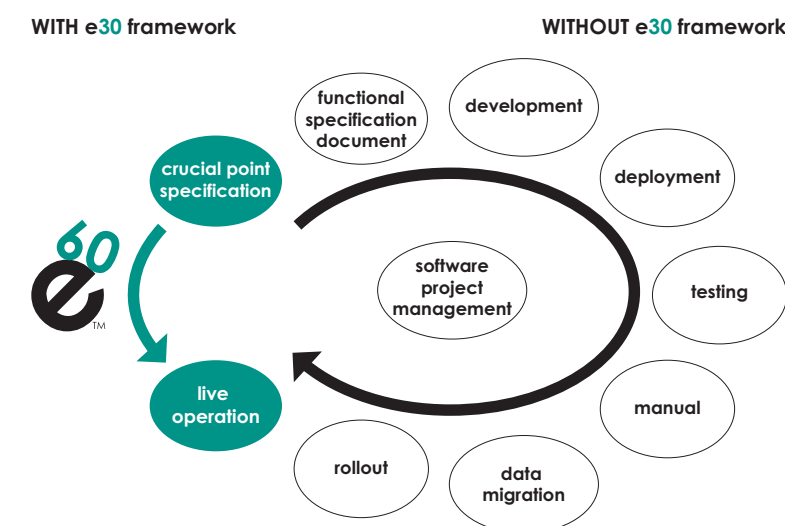

## Individualize standard software.

- freely selectable and changable specification of file names, file size, file settings, record and field length, key, attributes, forms and list formats.
- field definition, validation, journaling and user and permission management for fields and field content.
- direct access to data of other software systems
- freely definable files, tables and functions
- usage of personal and familiar terms, names and definitions
- extend ERP and logistic systems with additional software applications
- integration of **e60 ERP & Logistic** system into existing software environments

## A few steps to your independence.

Forget conventional project management. The **e30 Framework** replaces software project management processes with two steps:

- crucial point specification
- live operation

## More than standard software.

- no compiling
- industry- and trade-neutral
- multitenancy
- multilingual
- automated documentation and manual print
- Text-to-speech system
